Technical Skills

Languages: Python, Go, Java, TypeScript, JavaScript, Bash.

Frameworks / Development Tools: Flask, Django, React Native, Koa.js, Fastify.js, Node.js.

DevOps / CI/CD: Docker, Kubernetes, Jenkins, GitHub Actions, GitLab CI, Git.

AWS Technologies: Lambda, Step Functions, EC2, CloudFormation, CloudFront, MSK, S3, SQS.

Experience

Stripe

July 2026 – Present

Software Engineer II

Toronto, Canada

- Bank connectivity!

Electronic Arts (EA)

Jan 2025 – July 2026

Software Engineer II

Toronto, Canada

- Improved the backend system for EA's friends recommendation feature, *Recently Met*, building a near-real-time pipeline using Go, StarRocksDB, and Redis, serving **5M+ active players** through in-game tabs and the EA Connect mobile app, across all EA titles.
- Expanded recommendation coverage from 24 hours to 7 days through query optimizations, reducing processing time from **10+ min** → **10 sec** and enabling post-game recommendations within **15 sec**, boosting engagement by **20%**.
- Accelerated onboarding for new game titles by automating backend deployments with Helm charts and infrastructure-as-code, reducing integration time from **10 days** → **4 hours** and enabling faster rollout of the *Recently Met* feature across upcoming releases.
- Engineered a request-time validation API in Python to cross-reference ML recommendations with **live server telemetry**; ensured optimal player proximity and lobby density, driving a **15%** increase in *Battlefield 6* retention.
- Exploring the use of multi-armed bandits (MAB) and contextual variants (CMAB), to replace rule-based model selection in the recommendation service, enabling dynamic per-request selection of the best-performing model.

Capital One

Jan 2021 – Dec 2024

Senior Software Engineer

Toronto, Canada

- Re-architected an API serving credit card product information for **60K+ customers/month**, reducing response times from 8 sec → 0.7 sec and decreasing customer drop-off by **10%**.
- Built an SQS + AWS Lambda microservice in Python to whitelist Canadian contact points, ensuring accurate delivery of emails and messages.
- Migrated a monolithic applicant submission service to AWS Lambda-based microservices, cutting runtime costs by **80%**, eliminating EC2 maintenance, and improving latency by **3 sec**.
- Developed an API wrapper using AWS Lambda Layers and TypeScript to automatically fetch and cache authentication tokens, improving request performance by **2 sec per call**.
- Engineered a microservice using TypeScript to aggregate critical error logs for OSFI compliance, enabling **4 enterprise teams** to efficiently submit required logs.
- Built a React dropdown menu for an internal campaign tool, allowing analysts to select predefined SQL queries for common targeted segments, eliminating **100%** of repetitive queries for routine targets.
- Implemented a CloudFront Functions-based solution to restrict access to the credit card application website, ensuring only pre-approved customers could apply and were guaranteed approval, reducing rejected applications and improving overall customer experience.
- Reviewed resumes and technical assessments for prospective interns, ensuring thorough evaluation of qualifications and skills.

Education

University of British Columbia

May 2020

Bachelor's in Economics, Computer Science (GPA: 3.40 / 4.00)

Vancouver, Canada

- **Relevant Coursework:** Intermediate Algorithm Design, Machine Learning & Data Mining, Computer Architecture, Internet Computing, Computational Optimization.
